Leftist Heaps and Skew Heaps

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 1 / 41

- A binary heap provides $O(\log n)$ inserts and $O(\log n)$ deletes but suffers from $O(n \log n)$ merges
- A leftist heap offers $O(\log n)$ inserts and $O(\log n)$ deletes *and* $O(\log n)$ merges
- Note, however, leftist heap inserts and deletes are *more expensive* than Binary Heap inserts and deletes

- A *Leftist* (*min*)*Heap* is a binary tree that satisfies the following conditions. If X is a node and L and R are its left and right children, then:
 - $1 X.value \le L.value$
 - 2 X.value \leq R.value
 - null path length of L ≥ null path length of R

where the *null path length* of a node is the shortest between from that node to a descendant with 0 or 1 child. If a node is null, its null path length is -1.

Example: Null Path Length

Example: Null Path Length

-

< □ > < □ > < □ > < □ >

Example: Null Path Length

-

< □ > < □ > < □ > < □ >

Leftist Heaps

イロト イロト イヨト イヨ

Consider two leftist heaps ...

Task: merge them into a single leftist heap

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 8 / 41

First, instantiate a Stack

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Compare root nodes merge (x,y)

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 10 / 41

Remember smaller value

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 11 / 41

Repeat the process with the right child of the smaller value

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 12 / 41

Remember smaller value

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 13 / 41

Repeat the process with the right child of the smaller value

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 14 / 41

Remember smaller value

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 15 / 41

Repeat the process with the right child of the smaller value

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Because one of the arguments is null, return the other argument

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 17 / 41

Make 8 the right child of 7

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 18 / 41

Make 7 leftist (by swapping children)

Return node 7

.≣...>

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 20 / 41

Make 7 the right child of 6 (which it already is)

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 21 / 41

.≣...>

Make 6 leftist (it already is)

Return node 6

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 23 / 41

Make 6 the right child of 4

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 24 / 41

Make 4 leftist (it already is)

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 25 / 41

Final Leftist Heap

- Verify that the tree is heap
- Verify that the heap is leftist

Return node 4

- Height of a leftist heap $\approx O(\log n)$
- Maximum number of values stored in Stack
 ≈ 2 * O(log n) ≈ O(log n)
- Total cost of merge $\approx O(\log n)$

- To insert a node into a leftist heap, merge the leftist heap with the node
- After deleting root X from a leftist heap, merge its left and right subheaps
- In summary, there is only one operation, a merge.

- Simplify leftist heap by
 - not maintaining null path lengths
 - swapping children at every step
- A *Skew* (*min*)*Heap* is a binary tree that satisfies the following conditions. If X is a node and L and R are its left and right children, then:
 - $1 X.value \le L.value$
 - 2 X.value \leq R.value
- A *Skew* (*max*)*Heap* is a binary tree that satisfies the following conditions. If X is a node and L and R are its left and right children, then:
 - $1 X.value \geq L.value$
 - ② X.value ≥ R.value

First, instantiate a Stack

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 30 / 41

Compare root nodes merge (x,y)

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 31 / 41

Remember smaller value

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 32 / 41

Repeat the process with the right child of the smaller value

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 33 / 41

Remember smaller value

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 34 / 41

Repeat the process with the right child of the smaller value

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 35 / 41

Remember smaller value

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 36 / 41

Repeat the process with the right child of the smaller value

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 37 / 41

Because one of the arguments is null, return the other argument

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 38 / 41

Make 8 the right child of 7

(Leftist Heaps and Skew Heaps)

Data Structures and Programming

Spring 2017 39 / 41

Swap children of node 7

< ∃→

Final Skew Heap

- Verify that the tree is heap
- Verify that the heap is skew

Return node 4
